

Resumen

Título: Software Engineer

Descripción:

Software Engineer - Configuration management, a.k.a. "Master of Puppets" Spotify is looking for engineers eager for responsibility, who can join our self-empowered teams and contribute in both technical and non-technical ways. Who are we? Our backend consists of thousands of linux systems, spread out in many data centers. Managing the state of each of these machines would be an impossible task without automation of some kind. Meanwhile, our organizational model promotes small, autonomous squads to develop, configure, deploy and maintain the fruits of their labor. Today we have a stable configuration management system which enables management of said systems, but there is much to be improved. We want system configuration management to be intuitive, painless, and fast for our autonomous squads. You will be joining a small squad of talented engineers whos primary focus is continually improving our automated configuration management system. Here are two of the goals we have currently in our scope: • Developers get feedback on a configuration change for their feature service within ten seconds so that they can iterate faster. • Configuration and code is delivered and deployed as one unit, allowing users to push out changes using the same workflow for both code and configuration. Who are you? We are now looking for an outstanding engineer with heavy experience within the automated configuration management space to join our ranks. The engineer we're looking for has a strong backend developer background with proven sysadmin experience. We expect the following from all applicants: • Excellent programming skills in at least two of the following languages: Java, Python, or Ruby. • Deep understanding of *nix systems and great command-line skills. • Experience of managing configuration management systems such as Puppet, Chef, Ansible, etc. (We use Puppet). • Excellent written and spoken communication skills in English. • Not scared to to say "I don't understand, but please teach me." The following are not required but are a big fat plus: • Experience of designing and deploying a configuration management system. • Experience of designing and maintaining a continuous integration system. • Experience of designing and maintaining a continuous delivery system. This is a full time position, working out of our Stockholm, Sweden location. When applying, please provide your skype id and ensure that all documents are in PDF or TXT format.
